5 FACTS ON VACCINES

There's a lot of **conflicting information** out there **about vaccines**. **Question** what you read and hear – **and understand the facts**.

1. Vaccines are safe and effective.

Any licensed vaccine is rigorously tested before it is approved for use, regularly reassessed and constantly monitored for side effects. In the rare event a serious side effect is reported, it is immediately investigated.

2. Vaccines prevent deadly illnesses.

Vaccination protects children from diseases like diphtheria, measles, mumps and pertussis (whooping cough). Failure to vaccinate leaves children and adults vulnerable to diseases, complications or even death.

3. Vaccines provide better immunity than natural infections.

The immune response to vaccines is similar to the one produced by natural infection but less risky. For example: natural infection can lead to cognitive impairments from *Haemophilus influenzae* type b (Hib), birth defects from congenital rubella infection or irreversible paralysis from polio.

4. Combined vaccines are safe and beneficial.

Giving several vaccines at the same time has no negative effect on a child's immune system; reduces discomfort for the child; and saves time and money. Children are exposed to more antigens from a common cold than they are from vaccines.

5. If we stop vaccination, diseases will return.

Even with better hygiene, sanitation and access to safe water, infections still spread. When people are not vaccinated, infectious diseases that have become uncommon – diphtheria, measles, mumps and polio – quickly reappear.

Immunization Week in the 6 regions

AFR: *Vaccines protect everyone, get vaccinated!*

AMR: *#GetVax to celebrate a healthy tomorrow!*

EMR: *#Vaccines work*

EUR: *#Vaccines work*

SEAR: *#Vaccines work*

WPR: *Vaccination is everyone's job. Protect our children,
protect our community*

Malaria Vaccine Pilot Implementation

Progress to date

\$52.1m secured for phase 1 (2017-2020)

Coordinating mechanisms being set up

**Country selection and field implementation
planning initiated (Malawi, Kenya, Ghana)**

Joint regulatory review initiated

Master protocol for evaluation developed

ACCELERATED GVAP IMPLEMENTATION

GVAP mid-term report: some progress, but too slow to achieve goals

MISSED

POLIO:

Number of new cases of paralytic poliomyelitis due to wild poliovirus

MATERNAL AND NEONATAL TETANUS ELIMINATION:

Number of countries verified for elimination

COVERAGE AND EQUITY:

Number of countries with national vaccination coverage of 90%, with no district's coverage less than 80%

MEASLES:

Number of WHO regions to achieve measles elimination

RUBELLA:

Number of WHO regions verified for rubella and CRS elimination

Infants in the world according to their DTP3 vaccination status, 2015

Tackling the top operational challenges

Access & missed opportunities for vaccinations

Vaccine & supply chain management

Availability and use of quality data at all levels

The Reaching Every District's (RED) strategy revisited !

The AFRO revised “RED” guide

Emphasis on reaching equity in Immunisation (*new*)

- Targets: marginalized populations ie urban poor, migrants, ethnic/religious, etc...

Life course vaccination (*new*)

- Catch up on missed vaccination during 1st year of life
- “Routinize” 4th DTPc, MCV2, HPV

Integration of health services (*reinforced*)

HF and community level focus (*new*)

Addressing the “Missed Opportunities for Vaccinations” (MOVVs) to close the coverage gaps

Proportion of eligible infants missed for vaccinations

Children with multiple contacts per year

Reducing MOVs: time for bold actions !

- MOVs guidance manuals available
- Training of consultants
- Strong partnership support secured
- 20 countries to apply new norm :
“Every health contact, an opportunity to vaccinate”

19.4 million infants not immunized (DTP3), 2015

Progress update, Pakistan

- **Strong political support (Federal/some provinces)**
 - Gov financial contribution secured
 - Increased visibility and openness
 - Peer learning across provinces
 - Comprehensive EPI review for KP and Sindh in 2017
- **PEI-EPI synergy and collaboration improving**
- **MNT elimination validated/Rota vaccine introduced in Punjab province**
- **Ongoing work to improve data quality work**

IMMUNIZATION SUPPLY CHAIN AND LOGISTICS

A NEGLECTED BUT ESSENTIAL SYSTEM FOR
NATIONAL IMMUNIZATION PROGRAMMES

A CALL-TO-ACTION

FOR NATIONAL PROGRAMMES AND THE GLOBAL COMMUNITY BY
THE WHO IMMUNIZATION PRACTICES ADVISORY COMMITTEE

Effective Vaccine Management (EVM) global trends

120 EVM assessments reported from 83 countries in all regions.

Great improvements in Central Cold Chain Capacity, 2012-2016

Access to timely & affordable vaccine supply

Lower priced vaccines in emergencies

- 'Humanitarian mechanism' currently applied for PCV10 through MSF (Syria, South Sudan and Nigeria)
- GSK & Pfizer currently offering PCV at ~US\$3 under mechanism

Increasing Vaccine Price transparency

- Vaccine prices available for 70% of the world in 2016
- For many vaccines, significant spread in prices across different markets

Addressing vaccine shortages

- To pre-empt and manage vaccine shortages and enhanced access
- Current prototypes: BCG and D/d & T containing vaccine

Access to timely and affordable vaccine supply

MARKET UPDATE BCG VACCINE

Key Takeaways

- In 2017, supply of BCG is estimated to be 1.5X greater than forecasted demand. Given instability of the BCG manufacturing process, this extra supply is reassuring and confirms important progress relative to a bleaker supply-demand balance in recent years.
- However, demand flexibility is limited due to product registration constraints (~1/3 of countries have only one registered product) and supply is still concentrated with a few large suppliers (with prequalified (PQ'd) products) serving most countries (both self-procuring and procuring through UNICEF). Consequently, shortages at country level may still occur.

QUICK STATS

Suspended production in 2017: 3 (1 PQ'd)

2017 ESTIMATED MAX GLOBAL SUPPLY

~500M doses

2017 FORECASTED GLOBAL DEMAND

~350M doses

2015 REPORTED PRICE RANGE

US\$ 0.04-15.08 (Median: \$0.52)

Stockouts

Several short-duration stock-outs (max 1.5 months) were reported over ten years (2005-2015) across all regions, income groups, and procurement methods. The African region, low income (LICs) and lower-middle income countries (LMICs) were most affected. In 2014 and 2015 average stock-out duration increased. Stock-outs seem to be due to several factors: production issues, countries having only one product registered, timely availability of financing (national or external), procurement shortcomings, and inefficient vaccine management.

Global Demand

A model, based on country-reported EPI schedule, UN Population Division (UNPD) population, WHO-UNICEF estimated coverage, 50% wastage, and historical procurement data forecasts annual global demand at ~350M doses. Information on past country purchase shows that countries may be over-procuring BCG possibly due to actual wastage >50%, large country stocks, or country target population greater than UNPD estimates.

The greatest difference in forecasted demand and historical procurement is seen for self-procuring LMICs.

Global Supply

Between 2013 and 2015, manufacturing issues for most PQ'd suppliers led to temporary reduced production or suspension of production. Additionally, some non-PQ'd manufacturers exited the market. Nevertheless, supply increased significantly in 2016 as some of the manufacturers' production issues were resolved and one new supplier, Green Signal, was PQ'd. In 2017 supply is estimated to reach ~500M doses from 19 suppliers. The suppliers can be split in two groups: 1. four suppliers with PQ'd products that can reach 169 countries (86% of WHO member states) accepting UN procurement or where one of their products is registered and, 2. fifteen suppliers with non-PQ'd products that can serve 52 countries where they have product registered. In 2017/2018 three manufacturers are expected to be back online and additional capacity could be made available from one other manufacturer.

Supply-Demand Balance

In 2017 available supply of BCG is expected to be 1.5X greater than forecasted demand. Given instability of the BCG manufacturing process, this extra supply is sufficiently reassuring and confirms important progress relative to a bleaker supply-demand balance in recent years. Nevertheless, the BCG market is not risk free. Two main factors contribute to the risk:

- Supply concentration: two suppliers represent 50% of global vaccine supply and, importantly, 75% of supply of products PQ'd by WHO. The loss of a major supplier would not lead to a supply/demand imbalance, but certainly to a constrained supply situation requiring careful management. In those circumstances vaccine

requirements for self-procuring countries and countries procuring through UNICEF will need to be coordinated. Of note, the two major suppliers are released by the same National Regulatory Authority (NRA) - India.

- Limited demand flexibility: one third of countries have only one product registered and, as a result, may be at risk for shortages should a production issue occur. Among those, the most at risk are countries with BCG in the EPI schedule, a large birth-cohort, and that import, and thus have less control or visibility on production issues and risks.

Pricing

Over the past ten years, the price for BCG has remained low – the median reported price in 2015 was US\$0.52 (range \$0.04-15.08 for 29 reporting countries plus UNICEF and PAHO each included as a single price point). Pricing data (2015) for self-procuring countries shows that price per dose varies by income level, with high income countries (HICs) paying significantly more than middle income countries (MICs), albeit for different products/presentations. Disparity by region is also seen, notably, LMICs in AFR reported a much higher price per dose than EUR or WPR for the same product. Countries (excluding HIC WPR outlier) are paying up to 32X more than the UNICEF price. That said, country affordability has not been raised as an issue for the BCG market.

Recommendations

Global immunization stakeholders, countries, and manufacturers can work to enhance sustainable access to BCG supply by pulling four levers:

- Collect and share information on global demand, supply, and price of BCG to continue risk identification and problem solving
- Enhance supply management at country-level reducing procurement volumes when necessary
- Explore opportunities for registration of several BCG products in each country and/or accepting fast track procedure for PQ'd products
- Investigate the possibility of strengthening production processes of a few key manufacturers for supply security

Data Sources

Shortages: regional consultations (current), WHO/UNICEF Joint Reporting Form (JRF) stock-outs reported data (past)

Demand: historical procurement data review (JRF and UNICEF) and global demand forecast (Linkbridge/Gates Foundation Global Vaccine Market Model)

Supply: Nine manufacturers interviews (including the five PQ'd), review of 29 published articles and four policy papers concerning supply, UNICEF SD supply updates, JRF procurement data, PAHO Revolving Fund consultations

Pricing: historical data review (WHO Vaccine Product, Price and Procurement database (V3P), UNICEF SD, PAHO Revolving Fund)

Data Quality and use

Reference Guidance :

- Reference manual for Improved quality and use of Coverage surveys
- Routine immunization module in DHIS-2
- Electronic Immunization Registries Guide (AMR)

Strengthened coordination with DHS/MICs and with DHIS-2

Capacity building Workshops :

- Data workshops for National and subnational managers
- Desk review of 2016 cov data for all countries in AFR
- Consultants training

Identification and Outsourcing to collaborating institutions

- Support to national DQ assessment and coverage surveys

- New in JRF: collection of subnational data at global level in 2017

Monitoring Laboratory Performance by External Quality Assessment (EQA) Programs

Rotavirus EQA (2016)

Performance for RV Diagnosis by EIA

Performance for RV Diagnosis by Genotyping

Includes 19 China provincial labs, 7 Indian labs, 65 NLs, 9 RRLs, and 19 SSLs that participated in the 2016 Rotavirus EQA

Passing score cutoff for both EIA and genotyping for RRLs: 90%
all other labs: 80%

IBVPD EQA (2016)

Performance for IBVPD Diagnosis

Includes 9 RRLs, 25 NLs, and 82 SSLs that participated in the 2016 EQA that tested for Gram stain, culture ID, and genotypic ID (when applicable)

Passing score cutoff for RRLs: 90% SSLs and NLs: 75%

Rotavirus positivity in children <5 years hospitalized with diarrhea, Armenia

Hib Sentinel Surveillance Data in Bangladesh

Sultana et al Pediatrics 2013

Non b = type NT, a and f.

7/12 AFRO countries published results showing early impact of rotavirus vaccination in Africa and rotavirus; Sup 2 CID vol 62, May 2016

Our data work urgently requires improved partners' coordination and funding

Main challenges

Data not always available, complete or detailed enough

Data not always reliable, consistent over sources

Lack of “data use culture” and use for decision making

Inefficient information systems

Global level Governance on DQ

- Agree on a vision and on critical global and regional indicators
- Agree on data collection & sharing with Member States and across partners
- Define the role of SAGE and participating agencies

Adequate Financing

- Support both immunization and surveillance data systems
- Support All countries including non Gavi MLCs, in the polio transition context

VACCINES IN GLOBAL HEALTH AGENDAS

Vaccines & Anti-Microbial Resistance (AMR)

AMR, a global health threat

- **50 000 deaths in the US and Europe due to AMR costs \$20 billion/yr**
- **Predict mortality due to AMR at 10 million/yr by 2050**
- **Greatest impact will be in developing countries**

Vaccines & AMR

Strategies for vaccines

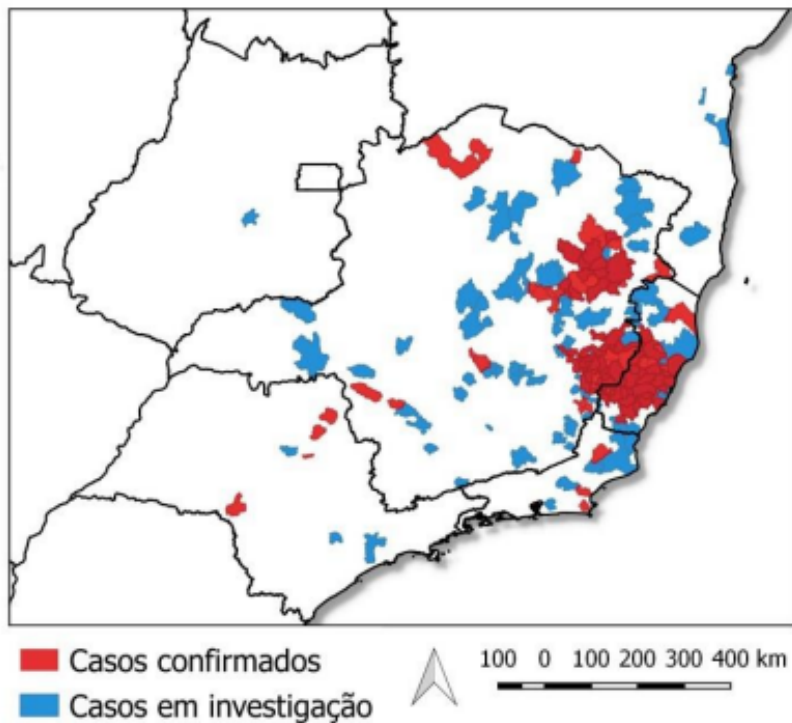

- Increased use of vaccines (PCV, HiB, pertussis but also influenza, rota)
- R&D :
 - Diseases where Antibiotics are less effective (TB, typhoid, STIs, etc)
 - Diseases treated with Antibiotics (GBS, GAS)

Impact of vaccine on antibiotic resistant invasive pulmonary disease in children in SA

Vaccines & Health Security

Emergency Yellow Fever vaccination in Brazil

PAHO support to NITAG, March 2017:

- **Suspension of booster dose**
- Protocol for use of dose-sparing approach in **Rio de Janeiro (+Sao Paulo and Bahia, as needed)**
- **Universal YF vaccination** for all children in Brazil for implementation in 2018.

WAYS FORWARD

The GVAP 'Leadership Council' meeting, Washington, DC, 21 Apr

- Pleased with progress in some areas; concerned with challenges in coverage and equity
- Sense of urgency in tackling GVAP shortcomings
- 'Sherpas' requested to come back with actions drawing from success and lessons from Polio Eradication and other immunization initiatives

GVAP at WHO Governing Bodies

- Executive Board, Jan 2017
 - Substantive discussion on GAVP Mid-term Report
- WHA, May 2017
 - GVAP Mid-Term Report (*Draft Resolution calls for reporting in 2020 and 2022*)
 - Polio transition
 - Technical briefing (high level panel)

AMERICAS: High level support to sustain the elimination of measles, rubella and CRS

- Strategy and Action Plan to sustain elimination to be presented for endorsement at the next Pan American Sanitary Conference (Sept 2017).
- Strategy Highlights :
 - Role of national commissions & annual reports to monitor sustainability.
 - Standardized mechanisms for rapid outbreak response in light of importations.

Reunión de sostenibilidad de la eliminación del sarampión, la rubéola
y el síndrome de la rubéola congénita
Panamá, 3-5 de abril de 2017

The strategy was discussed among participants of the recent measles-rubella regional meeting in Panama City

West Pacific to seek Member States endorsement of new plan for Measles and Rubella Elimination*

Categories		Countries, Areas, Epidemiological Blocks**
1	Verified as having achieved elimination	Australia, Brunei Darussalam, Cambodia, Japan, Macao (China), Republic of Korea, and Hong Kong (China),
2	Achieved elimination but deferred verification (ongoing outbreak)	New Zealand
3	Approaching elimination, but with surveillance gaps	Lao People's Democratic Republic, Pacific islands, Singapore
4	Re-established transmission and Endemic measles virus transmission	Mongolia, China, Malaysia, Papua New Guinea, the Philippines, Viet Nam

*** TAG recommendation: WHO to finalize the drafting of a new regional strategy and plan of action in collaboration with TAG, NIPs and partners**

**** as of Sept 2016**

EUROPE: GUIDANCE WELL RECEIVED BY MEMBER STATES

Recent EURO price transparency work, demand & acceptance support, financial sustainability focus and establishment of Hep B verification and control programme

Targeted interventions in measles and rubella endemic countries and verification of the elimination at country-level leading to increased focus on elimination efforts by Member States

Steady progress made in M&R elimination (~70% MS have interrupted &/or eliminated)

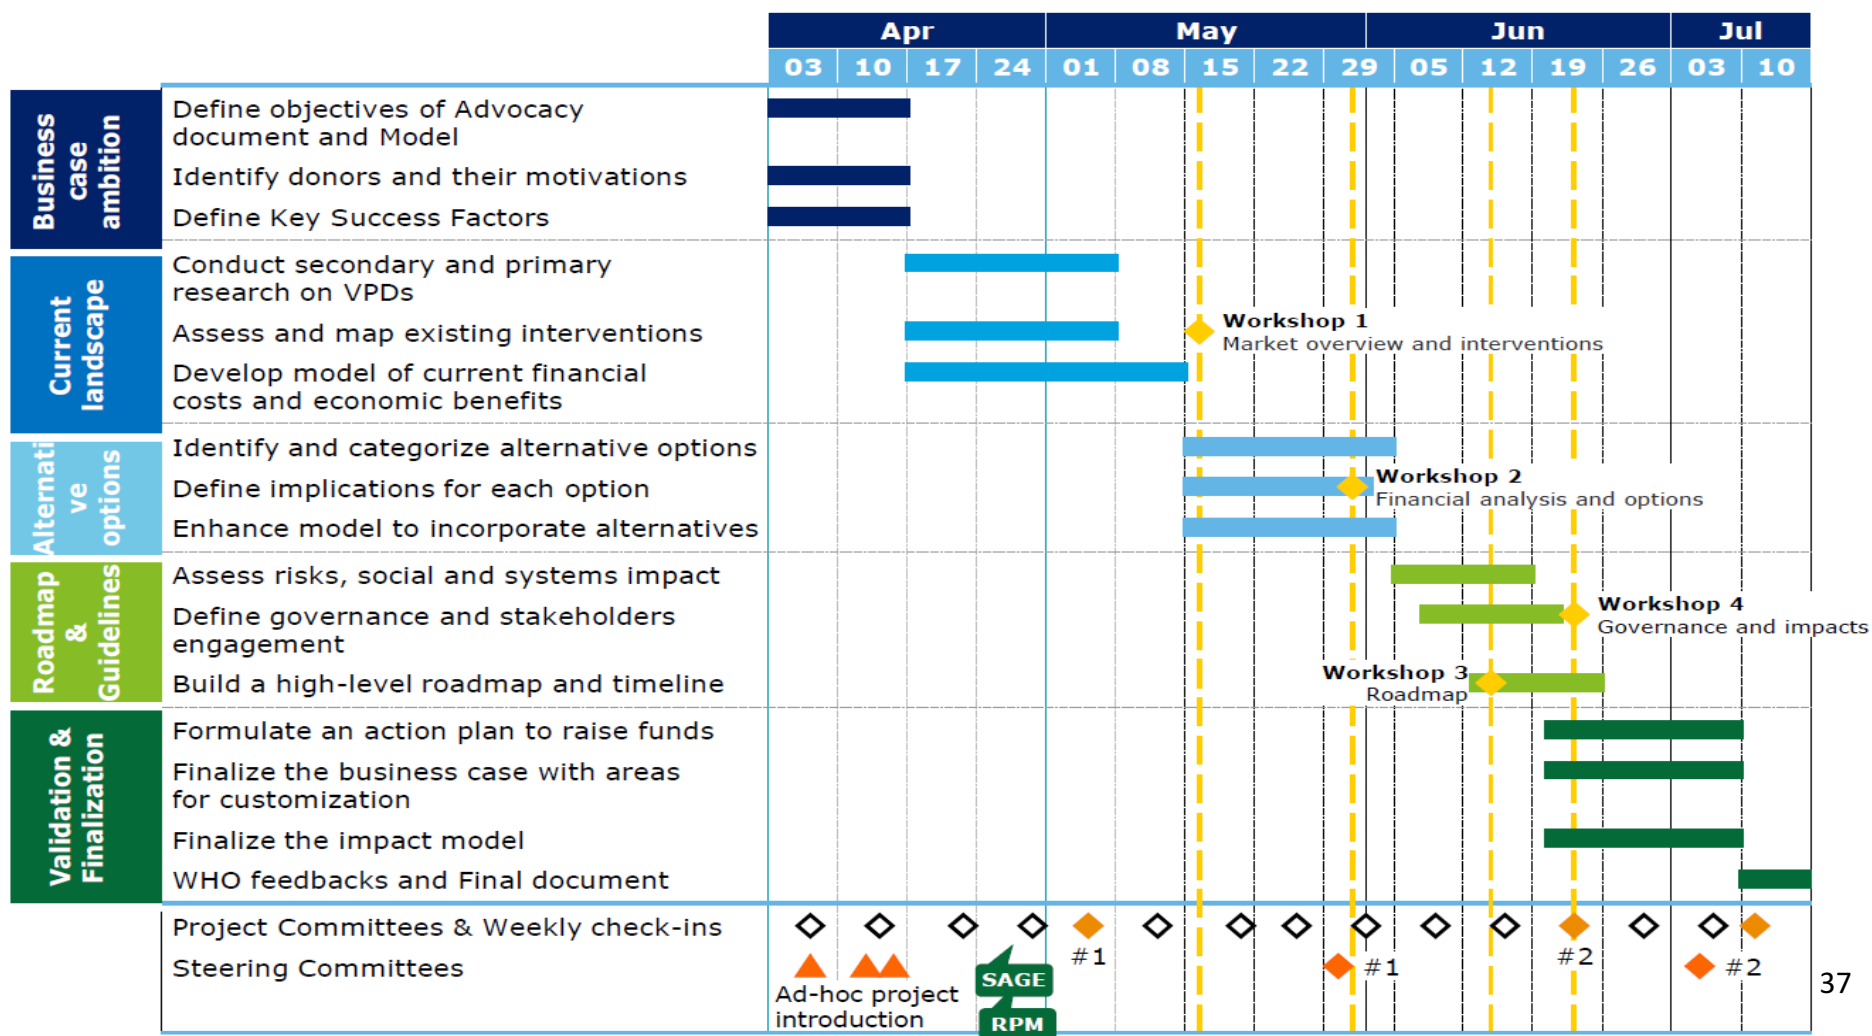

AFRICA: Highest level support to Universal Vaccination

- African Union Summit endorses the Declaration on “Universal Access to Immunization as a Cornerstone for Health and Development in Africa”
- Roadmap to support the implementation of the Declaration finalized.

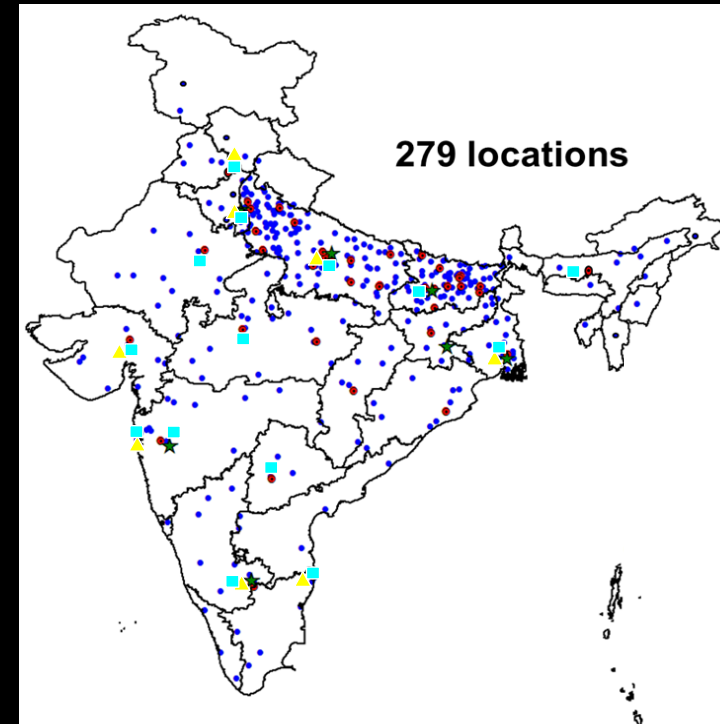

WHO Business Case for Immunization on the African Continent – Ambitions and Timeframe

Transition planning in India – progress so far

Priority public health needs for potential support by polio workforce
(identified jointly by government and WHO)

Public health needs	Area identified by
Polio	Gol, WHO
Routine immunization, introducing and scaling up new vaccines & health system strengthening	Gol, States
Urban health	Gol
Measles elimination & rubella control	Gol, WHO
VPD surveillance	Gol
NTD: Kala Azar, Lymphatic Filariasis, etc.	Gol, Affected states
Leprosy	Gol, Affected states
RMNCH+A	Gol
Malaria	Gol, Affected states
IDSP	Gol/NCDC
Dengue, Chikungunya, Zika	Gol?
Emergency/Disaster preparedness	State government

Mapping of POLIO assets (HR & infrastructure), India

Where on the vaccine and immunization value chain is the WHO/IVB department involved?

IVB/EPI priorities: Immunization Programme Monitoring & Surveillance

Work areas and key outputs:

Monitoring and reporting on immunization programmes and vaccine preventable diseases

- Produce norms and standards for immunization and VPD surveillance data collection and use
- Collect, collate and disseminate national and subnational data
- Analysis, interpretation and visual representation of key immunization data

National information systems to guide immunization programmes

- Publish guidance on monitoring and assessing programme performance
- Provide guidance on use of innovative information and communication technologies and information systems

Surveillance of VPDs and vaccine safety supported by a well-functioning laboratory networks

- Provide country wide surveillance, safety and outbreak monitoring
- Provide sentinel site surveillance with impact monitoring
- Provide high performing laboratory networks to support surveillance and outbreak preparedness

The new Global Vaccine Framework GVAP 2.0 by 2020 !

Sustain current DoV momentum after 2020 with definition of a "Global Vaccine and Immunization Framework" for the Decade 2021-2030

Timeline: aim for approval by WHA (May 2020)

Coordination: GVAP Secretariat to coordinate and monitor progress

SAGE: Selected topics on the horizon

(*tentatively planned for October 2017)

Cross-cutting

- ◆ GVAP monitoring of progress and plans for Global immunization strategy 2021-30*
- ◆ Quality and use of global immunization and surveillance data
- ◆ Use of vaccines in immunocompromised populations
- ◆ Vaccine health economics
- ◆ Strategies to reach older age groups
- ◆ Maternal vaccination
- ◆ Middle Income countries strategies
- ◆ Emergency vaccine development
- ◆ Heterologous prime-boost -issues for policy and use
- ◆ Combination products
- ◆ Optimizing immunization schedules
- ◆

Vaccine specific

- ◆ Polio eradication*
- ◆ Measles and rubella elimination*
- ◆ Typhoid*
- ◆ Rabies*
- ◆ BCG*
- ◆ Pneumococcal conjugate vaccines*
- ◆ Influenza vaccines
- ◆ Meningitis B
- ◆ Rotavirus
- ◆ RSV
- ◆ Mumps
- ◆

Conclusions

- **“Smallpox has succeeded only because it reached beyond the established services and childhood immunization should do the same...” (R. Henderson in “Immunising the children of the world”, 2016)**
- **Meeting the GVAP goals requires working differently with a sense of urgency, sustained focus on reaching the goals and secured high level support !**

THANK YOU !
